LAN/WAN

With a personal computer on each desk, so-called distributed data processing emerged with a need to connect all PC's in a given area and to share data files together. This is how the local area network (LAN) was born.

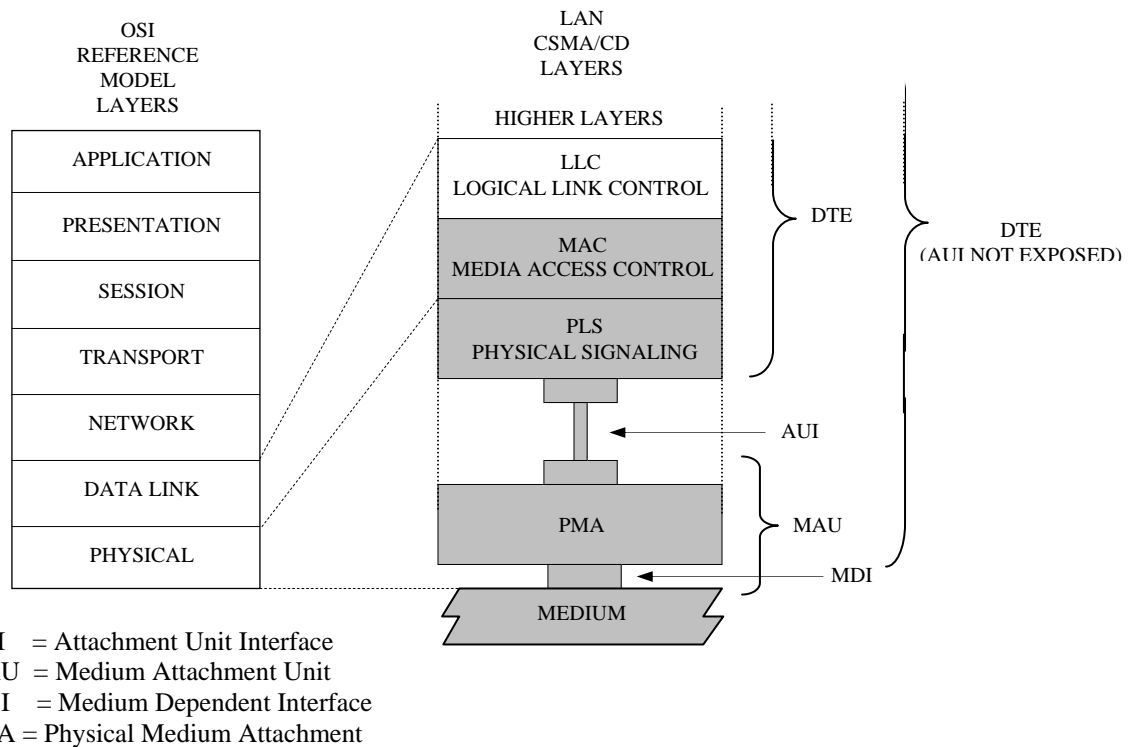

Today LAN's can have hundreds or even thousands of users (nodes) connected together. In large networks, segments are created so that problems can be easily isolated and eliminated. Over the years there have been many networking schemes, each with advantages and disadvantages. Today, Ethernet is the most prominent LAN in offices.

While LAN's are adequate for small companies with one office, larger companies with multiple offices need more complex networks.

So we have:

- MAN – Metropolitan Area Network
- WAN – Wide Area Network
- Global Net – Global - Many countries
- Internet – Global - Worldwide
- Intranet - Within the same company-multiple networks, networked
- Mobile Net - Cellular phone network
- Telephone Network - Global
- SAN - Storage Area Network

In discussing LOCAL AREA or WIDE AREA NETWORK, typically OSI (Open Systems Interconnection), a reference model, is used as shown below.

ISO/IEC 8802-3 (IEEE 802.3) relationship to the ISO/IEC Open System Interconnection (OSI) reference model.

S.I. Tech Fiber Optic products fall into physical and data link layers of the model.

LOCAL AREA NETWORKS

As the term implies, computers located in a given area such as an office or factory can be networked (connected together) in a particular scheme. Today's Local Area Networks are comprised of many special inter connecting schemes, each with unique benefits and disadvantages. Basic configurations are:

1. Bus Network: all users are attached to a common BUS.

2. Ring Network

3. Star Network

4. Tree Network: Combining these concepts into various fashions, today's complex LAN's are set up.

IEEE – Institute of Electrical and Electronic Engineers have developed many LAN standards and new ones are continually created. Some of the present standards are:

- IEEE 802.1 - Relationship between IEEE and ISO model
- IEEE 802.2 - Network control protocol
- IEEE 802.3 - Ethernet Local Area Network
- IEEE 802.4 - Map/Top Local Area Network
- IEEE 802.5 - Token Ring Local Area Network
- IEEE 802.6 - MAN Network
- IEEE 802.7 - Broad Band Local Area Network
- IEEE 802.8 - Fiber Optic CSMA/CD
- IEEE 802.9 - Integrated Voice and Data
- IEEE 802.10 - Interoperable LAN/MAN security
- IEEE 802.11 - Wireless LAN
- IEEE 802.12 - Demand priority access method. Repeater spec.
- IEEE 802.14 - Cable TV based Broad Band Network
- IEEE 802.15 – Wireless Personal Area Network (WPAN)
- IEEE 802.16 – Metropolitan Area Network - Wireless

A short description on the more common networks is given below:

ARCNET:	A token passing BUS network, developed by Datapoint. Runs at 2.5Mbps and uses 93 ohm coaxial cable as a medium.
Ethernet:	Is a BUS network using CSMA/CD scheme. Today's business world predominately uses Ethernet as a networking protocol. Ethernet is well developed with low cost devices for 10 and 100Mbps. 1 gigabit and 10 Gbps systems are available and higher speeds under development. (40 and 100 Gbps)
Token Ring:	The token access procedure used on a network with a sequential or ring topology. Popularized by IBM. Runs at 4 and 16Mbps. FDDI, which is token ring, runs at 100Mbps.
Map/Top:	The token passing BUS network for the Manufacturing Industry.
FDDI:	Fiber distributed data and token ring network running at 100Mbps has counter rotating rings for redundancy.
Internet:	Global computer network, where everyone has access to Worldwide Web. Wide ranging access speeds are available.
Telephone Network:	Global network of all telecommunications equipment, telephones.
SONET:	Synchronous optical network – used for high speed telecom connections. Speed ranges from OC-1 to OC-768. (51Mbps to 40Gbps.)
Fire wire	IEEE 1394 – 800 Mbps

Common features of all fiber optic networking products offered by S.I. Tech:

Industry refers to S.I. Tech products by various names such as line drivers, media converters, transceivers, etc. The basic concept is to use fiber optics wherever possible and required or specified. Fiber can be used in place of unshielded twisted pair (UTP), shielded twisted pair (STP), coax, twinax, radio, or satellite connection with appropriate interface and product design.

While fiber optics can exceed distance limitations of various networking specifications, network engineers should consider networking issues such as time out, software limitations, equipment compatibility, etc.

Typical operating distances for fiber optic cables

*Longer distances are possible and available with special designs. Various connector options are available, such as SMA/ST/FC/SC/MT-RJ/LC

S.I. Tech supplies indoor/outdoor Fiber Optic cables and cables with connectors. Fiber Optic Repeater/Mode (size) Converters: S.I. Tech model 2062 and 2082 are designed to convert multimode fiber any size to any other size or can also be used to convert any size multimode to single mode fiber. The 2062 has a maximum data speed of 20 Mbps and the 2082 has a maximum data speed of 1000 Mbps.

2082-MM/MM	2082-MM/SM	2082-SM/SM

Additionally, these products can also be used to extend the distance of a fiber optic link or overcome excessive link loss (attenuation).

Power Cord: 3 Pin International Standard Cord

Status Indicators: All products come with status indicator LEDs to show network activity, fiber link activity, power, collision, and other indicators. Refer to chart or individual data sheet for specifics.

All S.I. Tech products are UL listed where applicable. Many are CE compliant. Meet ROHS and WEE regulations,

TRANSMISSION MEDIA:

- Twisted Pair
- Coaxial Cable
- Fiber Optics
- Satellite
- Radio

TWISTED PAIR – is the lowest cost transmission medium available within buildings, as most of the time, telephone wiring exists in all buildings. Over the years, cable manufacturers have significantly improved transmission properties of unshielded twisted pair (UTP) or shielded twisted pair cables (STP). These are now classified by EIA/TIA (Electronic Industries Association/Telecommunication Industry Association) “category of performance” standards based on carrier frequency in Hz or MHz. This translates roughly into the following data rates in Mbps.

CAT	Cable Type	Max Data Rate
1	UTP	Below 1 Mbps
2	UTP	4 Mbps
3	UTP/STP	16 Mbps
4	UTP/STP	20 Mbps
5	UTP/STP	100 Mbps
5e	UTP/STP	200 Mbps
6	UTP/SFTP*/STP	1000 Mbps
7	SFTP	1/10 Gbps

*Foil Shield

COAXIAL CABLES: IBM SNA, ARCNET, and ETHERNET are coaxial cable based networks. Both IBM SNA and ARCNET use 93 ohm, low capacitance cable. Ethernet Trunk Cable is typically 50 ohm thick coax (yellow cable) and Ethernet Distribution Cable is thin coax, RG-58/U.

As we all know, attenuation (loss) in coaxial cable goes up with frequency and distance. The higher the data rate and the longer the distance, the higher the loss. This limits the distance that cable can be used effectively without amplification (Boosters, Repeaters). Cable television, which typically uses 75 ohm coaxial cable, uses repeaters on poles to boost the signal.

S.I.Tech 2062 and 2082 can be factory configured to change one fiber size or optical fiber such as 200 micron to 62.5, 50 to 62.5 micron, or multimode to single mode. See ordering information table below.

Table 1: 2062 Combinations

2062-SM/SM-ST	Single Mode to Single Mode Repeater - ST

* If you need to go long distances 10km or more, use 1310nm TR/REC (designable as SM/SM)

** Use with S.I.Tech #9402-0008-5568 fiber cable assembly

Table 2: Operating Distance for Fiber Optic Cable

* Single mode (observe network timing restriction)

The 2062 and 2082 needs to be properly configured in order to be compatible with your system. For instance, if you are using:

- A. CISCO equipment with 850nm wavelength transmitter/receiver made for multimode fiber, then the S.I.Tech 2062 and 2082 port used with that CISCO equipment needs to be 850nm wavelength TR/REC. Similarly if remote end is 1300nm TR/REC then 2062 and 2082 port connecting to remote end should support 1300nm TR/REC.
- B. Typical Application – Fiber Size Conversion

Note: Always Connect T to R and R to T as shown above.

S.I.Tech 2062 can be used up to 25Mbps as a repeater. If your data rate is higher such as 100 Mbps or Gigabit (1000 Mbps), use S.I.Tech #2082

Table 3: 2082 Combinations
Ordering Information

2082-SM/SM-1000	Single mode to Single mode Repeater for up to Gigabit. SC to SC

Notes:

1. Single mode (1300nm) is supplied with SC connectors as standard (FC optional).
2. **Check fiber bandwidth spec to determine length limitation.**
3. Check link loss (attenuation).
4. Single fiber option.
5. For proper operation 2082 fiber size converter should be matched to customer equipment e.g. If your Transmitter/Receiver is 850nm, S.I.Tech 2082 TR/REC should be 850nm. For 1300nm use 1300nm rated 2082.

* Single mode option (for long distance, higher power, contact factory.)

At Gigabit data rate both attenuation and bandwidth of the fiber should be considered to determine distance.
